

Session 2A

16 Ft High Parallel Panel Test and MCM Facades

FM Global developed the 16 ft parallel panel fire test several years ago as a more cost-effective alternative to the 25 and 50 ft corner test. This test has been used as part of FM 4880 and the more recently published FM 4411 Approval test standard. This presentation will discuss test applications, test parameters, pass-fail criteria and comparative fire test data with MCM assemblies.

Richard J. Davis, P.E., FSFPE, M. ASCE
Staff Vice President, Senior Engineering Technical Specialist
FM Global

Dick Davis has a B.S. from Lowell Tech and a M.S. from Worcester Polytech. He holds a P.E. in Fire Protection Engineering and a P.E. in Structural Engineering. He has worked for FM Global and legacy FM Engineering and Research for over 44 years. He is a Past President of the New England Chapter of SFPE, a Fellow and Past President of SFPE international and a member of the SFPE PE Exam Development Committee. He is a member of the following NFPA Committees; Fire Test, Smoke Management, Building Construction, Structures and Materials, Construction and Demolition and Hazard and Risk of Contents and Furnishings.
